GLASSHOUSE OPERATIONS STORAGE SHED ST LUCIA

Consideration:

There is a severe lack of storage space for the glasshouse services work group. This includes areas for specialised potting mix, soils, pots and bench space. Provision of a dedicated storage and work facility will alleviate the current space issues and reduce the amount of untidiness and visual impact of outside storage of items used in glasshouse research.

Description:

The proposal for the new 10.5 by 8.85 by 3.6 metre high Glasshouse Storage Shed comprises a reinforced concrete floor and a structural steel frame with prefinished metal external cladding. A number of aluminium windows provide natural lighting where required. A galvanised steel gate at the front of the building secures the site. Rainwater tanks at the rear of the building harvest roof water from the building. Internally the shed will have provision for soil storage and a work bench area.
